Number of Solutions to $a^x + b^y = c^z$

Abstract: For relatively prime integers $a$ and $b$ both greater than one and odd integer $c$, there are at most two solutions in positive integers $(x, y, z)$ to the equation $a^x + b^y = c^z$. There are an infinite number of $(a, b, c)$ giving exactly two solutions. The proof uses only elementary methods.
